- DESCRIPTION of the Experiment
- ANALYSIS of Raw Data Records
- SYNTHESIS of the Anisotropic Medium
- CONCLUSIONS

## Weak Anisotropy (Chapman & Pratt(1990))

- Rays from a background isotropic medium
- For each ray segment  $T = dl s_{\theta}$

$$s_{\theta} = A \cos^4(\theta) + B \cos^2(\theta) \sin^2(\theta) + C \sin^4(\theta)$$

$$A = s_x, \quad C = s_z, \quad B = 4s_{45} - (s_x + s_z).$$

- 56 × 56 Equations from raytracing:

$$T_{jk} = \sum_i a_{ijk} s_x(i) + \sum_i b_{ijk} s_z(i) + \sum_i c_{ijk} s_{45}(i)$$

- 56 equations constraining  $s_z$  against the log:

$$\gamma_1(s_z(i) - s_{\log}(i)) = 0$$

- 49 smoothness equations:

$$\gamma_2(s_\theta(i) - s_\theta(i + 1)) = 0$$

- 56 × 3 unknowns.

ISOTROPIC TOMOGRAM

**ANISOTROPIC TOMOGRAM**

- DESCRIPTION of the Experiment
- ANALYSIS of Raw Data Records
- SYNTHESIS of the Anisotropic Medium
- CONCLUSIONS

- The anisotropy really is incontrovertible.
- $s_z/s_x$  in the Del Rio Clay ranges from 1.15 to 1.30.
- Isotropic tomograms may be dangerously misleading.
- Event identification using only the common-depth gather is perilous.
