ICFP 2022

Liquid-gas phase separation & self-propulsion

- Phase separation in Equilibrium: Energy vs Entropy

$\longrightarrow$ Attractive forces: cohesion vs disorder

$\longrightarrow$ Lowering T: liquid-gas coexistence

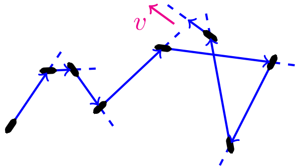
Liquid-gas phase separation & self-propulsion

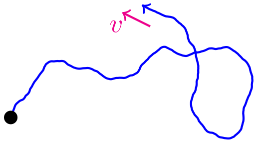
- Phase separation in Equilibrium: Energy vs Entropy

  ⟶ Attractive forces: cohesion vs disorder

  ⟶ Lowering T: liquid-gas coexistence

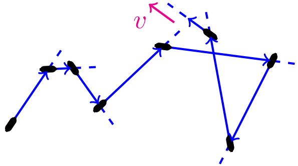
- Active particles: increasing v first vaporises the liquid •



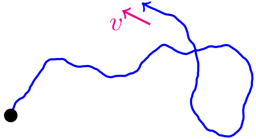


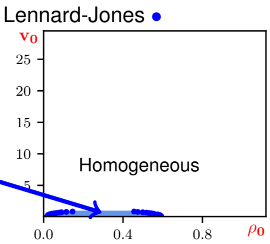
Liquid-gas phase separation & self-propulsion

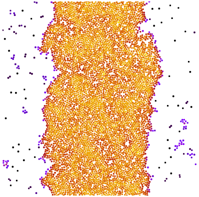
- Phase separation in Equilibrium: Energy vs Entropy
  - ⟶ Attractive forces: cohesion vs disorder
  - ⟶ Lowering T: liquid-gas coexistence



- Active particles: increasing v first vaporises the liquid •





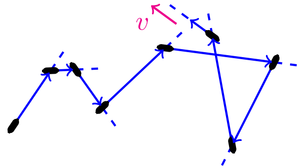


Equilibrium Phase Separation

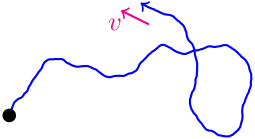
[Credits Gianmarco Spera]

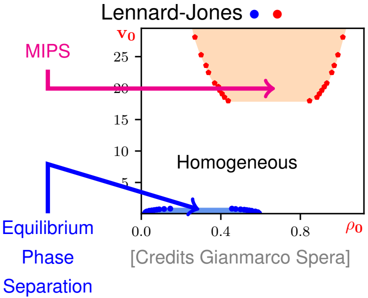
Liquid-gas phase separation & self-propulsion

- Phase separation in Equilibrium: Energy vs Entropy
  - ⟶ Attractive forces: cohesion vs disorder
  - ⟶ Lowering T: liquid-gas coexistence

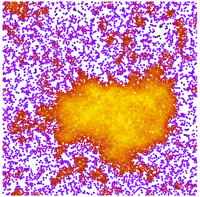


- Active particles: increasing v first vaporises the liquid •
  - ⟶ Reentrant transition [Redner *et al.* PRE 2013]





[Credits Gianmarco Spera]



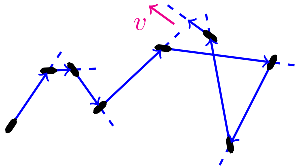
- Motility-Induced Phase Separation (MIPS)

Liquid-gas phase separation & self-propulsion

- Phase separation in Equilibrium: Energy vs Entropy

  ⟶ Attractive forces: cohesion vs disorder

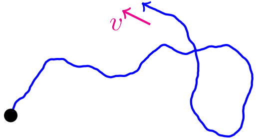
  ⟶ Lowering T: liquid-gas coexistence

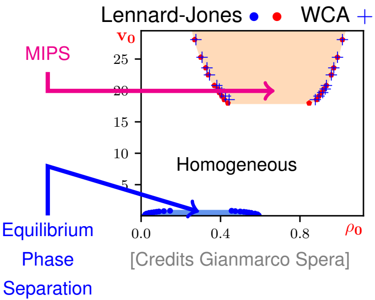


- Active particles: increasing v first vaporises the liquid •

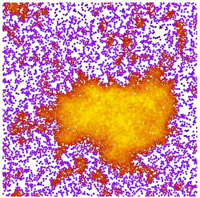
  ⟶ Reentrant transition [Redner *et al.* PRE 2013]

  ⟶ No need of attractive forces!





[Credits Gianmarco Spera]



- Motility-Induced Phase Separation (MIPS) ⟶ Cohesive matter without cohesive forces

Liquid-gas phase separation & self-propulsion

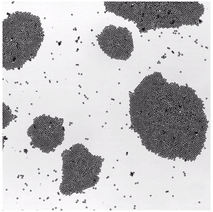
[Liu *et al.* PRL 2019]

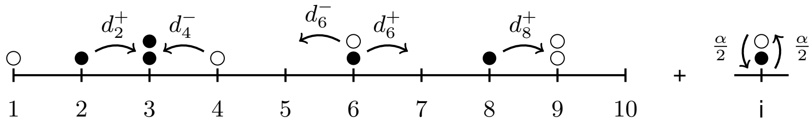


[Van Der Linden *et al.* PRL 2019]

- Motility-Induced Phase Separation (MIPS) ⟶ Cohesive matter without cohesive forces

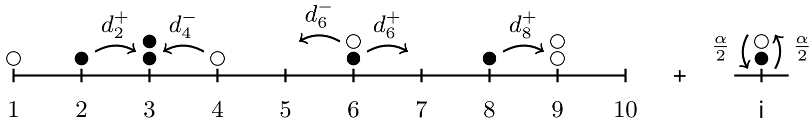
Phase coexistence without cohesive forces

- Lattice-gas model of run & tumble particles (RTP)
  [Thompson et al. JSTAT 2011, Soto & Golestanian, PRE 2014]

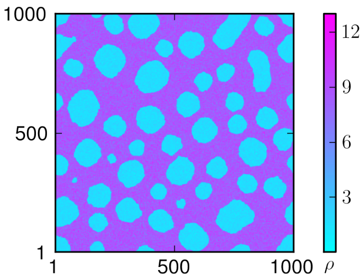


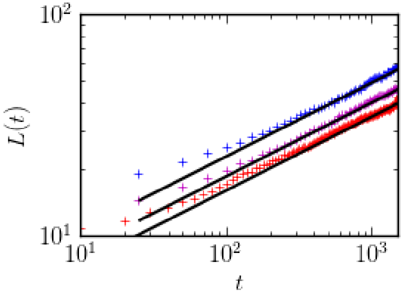
Phase coexistence without cohesive forces

- Lattice-gas model of run & tumble particles (RTP)
  [Thompson et al. JSTAT 2011, Soto & Golestanian, PRE 2014]

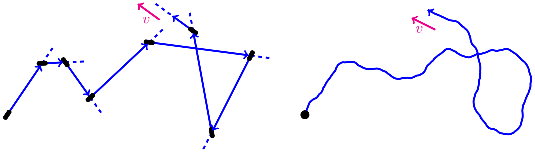


- Exclusion: $d_i^{\pm} = v_0(1 - \frac{n_{i\pm1}}{n_M})$



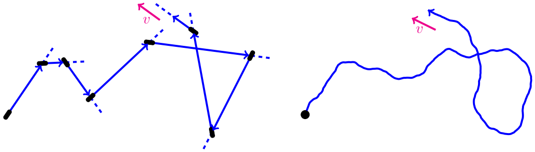


- Quorum-sensing self-propelled particles with tumbles/rot. diff.



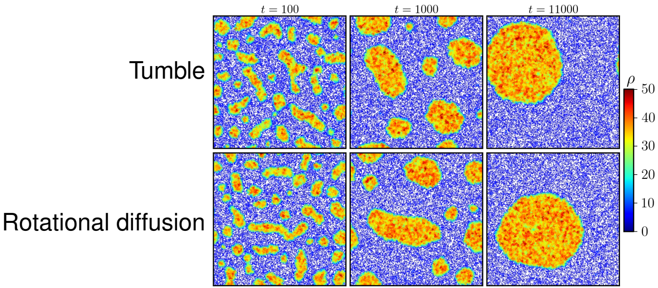
$$\dot{\mathbf{r_i}} = v[\tilde{\rho}(\mathbf{r_i})]\mathbf{u}(\theta_i); \qquad \tilde{\rho}(\mathbf{r_i}) = \sum_j K(|\mathbf{r_i} - \mathbf{r_j}|)$$

- Quorum-sensing self-propelled particles with tumbles/rot. diff.



$$\dot{\mathbf{r}}_\mathbf{i} = v[\tilde{\rho}(\mathbf{r}_\mathbf{i})]\mathbf{u}(\theta_i); \qquad \tilde{\rho}(\mathbf{r}_\mathbf{i}) = \sum_j K(|\mathbf{r}_\mathbf{i} - \mathbf{r}_\mathbf{j}|)$$

- If $v(\rho)$ decreases as ρ increases $\longrightarrow$ Phase separation

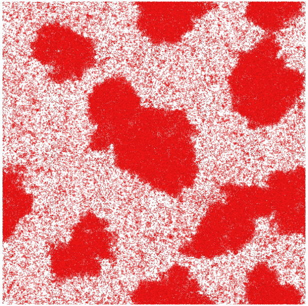


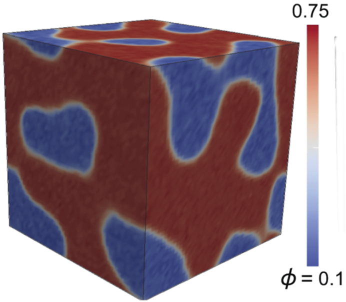
[Cates, JT, EPL 2013; Solon, Cates, JT, EPJST 2015]

- Self-propelled particles with pairwise forces

  [Fily & Marchetti PRL 2012, Redner *et al.* PRL 2013, Stenhammar *et al.* PRL 2013, Bialké *et al.* PRL 2013, etc.]

$$\dot{\mathbf{r}}_\mathbf{i} = v\mathbf{u}(\theta_i) - \mu \sum_j F_{ij}(\mathbf{r}_\mathbf{i} - \mathbf{r}_\mathbf{j}) + \sqrt{2D_t}\eta_i; \qquad \dot{\theta}_i = \sqrt{2D_r}\xi_i$$





- Not-so-self-propelled particles with pairwise forces
  [Fodor *et al.* PRL 2016, Martin *et al.* PRE 2021]

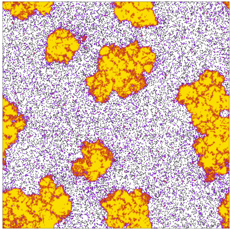
$$\dot{\mathbf{r}}_{\mathbf{i}} = \mathbf{v}_{\mathbf{i}} - \mu \sum_{\mathbf{j}} \mathbf{F}_{\mathbf{ij}}(\mathbf{r}_{\mathbf{i}} - \mathbf{r}_{\mathbf{j}}) + \sqrt{\mathbf{2D_t}}\boldsymbol{\eta}_{\mathbf{i}}; \qquad \tau\dot{\mathbf{v}}_{\mathbf{i}} = -\mathbf{v}_{\mathbf{i}} + \sqrt{\mathbf{2D}}\xi_{\mathbf{i}}$$

- Particles powered by Ornstein-Uhlenbeck process $\langle \mathbf{v_i}(t)\mathbf{v_i}(0)\rangle = \frac{D}{\tau} e^{-t/\tau}$

- Not-so-self-propelled particles with pairwise forces
  [Fodor *et al.* PRL 2016, Martin *et al.* PRE 2021]

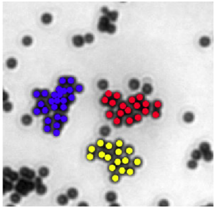
$$\dot{\mathbf{r}}_\mathbf{i} = \mathbf{v}_\mathbf{i} - \mu \sum_\mathbf{j} \mathbf{F}_\mathbf{ij}(\mathbf{r}_\mathbf{i} - \mathbf{r}_\mathbf{j}) + \sqrt{\mathbf{2D_t}}\boldsymbol{\eta}_\mathbf{i}; \qquad \tau\dot{\mathbf{v}}_\mathbf{i} = -\mathbf{v}_\mathbf{i} + \sqrt{\mathbf{2D}}\xi_\mathbf{i}$$

- Particles powered by Ornstein-Uhlenbeck process $\langle \mathbf{v}_\mathbf{i}(t)\mathbf{v}_\mathbf{i}(0)\rangle = \frac{D}{\tau}e^{-t/\tau}$

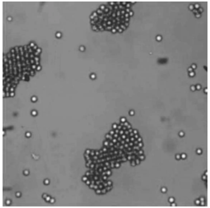


- Very generic in toy models of active systems

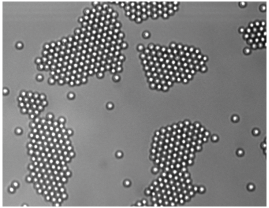
- Experiments: Active colloids (role of attractive interactions?)



[Theurkhauff *et al.* PRL 2012]



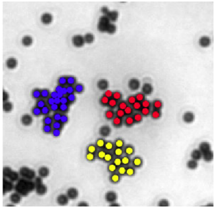
[Buttinoni *et al.* PRL 2013]



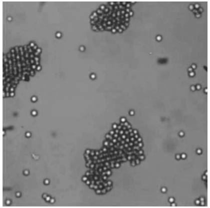
[Palacci *et al.* Science 2014]

- Enhanced tendency to clustering

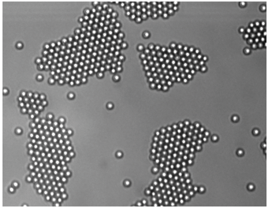
- Experiments: Active colloids (role of attractive interactions?)



[Theurkhauff *et al.* PRL 2012]



[Buttinoni *et al.* PRL 2013]



[Palacci *et al.* Science 2014]

- Enhanced tendency to clustering
- Real life far too messy (hydrodynamics, chemically mediated interactions, systems slow & dilute, aligning interactions, etc.)
- Idea: understand simple systems first before moving to more complicated situations.
