2N-SRC

Nucleons in the pair have high relative momentum and low center of mass momentum relative to k_F .

2N-SRC

Each individual nucleon has high momentum

Nucleons are at close proximity in the nucleus

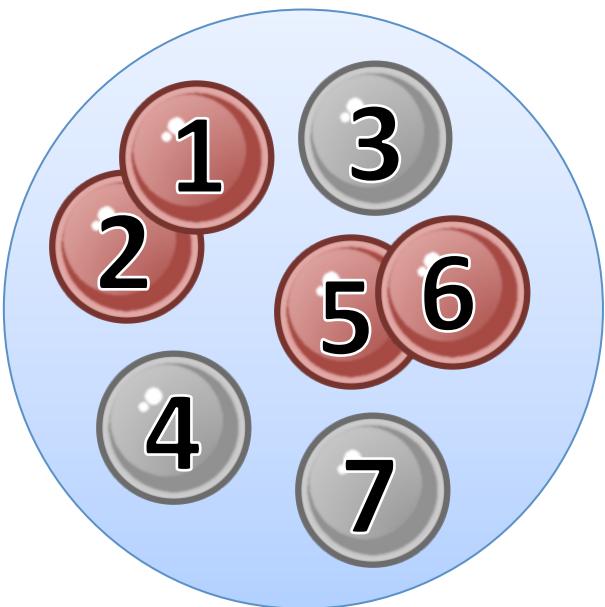

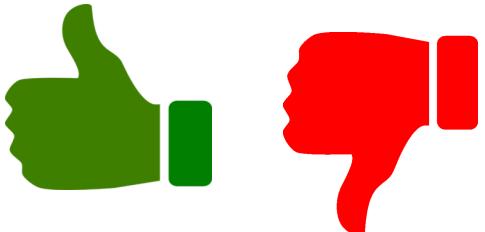

2-Body momentum distributions

- One Body momentum distribution [$n_N(k)$]:
Probability to find a nucleon, N, in the nucleus with momentum k.
- Two Body momentum distribution [$n_{NN}(q,Q)$]:
Probability to find a NN pair in the nucleus with relative momentum q, and c.m. momentum Q.

$n_{NN}(q,Q)$ – computational Frontier!

2-Body momentum distributions

- $n_{NN}(q,Q)$ – Mathematical object that counts all possible NN pairs, regardless of their state:

Consider all NN pairs:

1-2	5-6			
3-4	3-7	4-7		
1-5	1-6	2-5	2-6	
1-3	1-4	1-7	2-3	
2-4	2-7	3-5	4-5	
5-7	3-6	4-6	6-7	

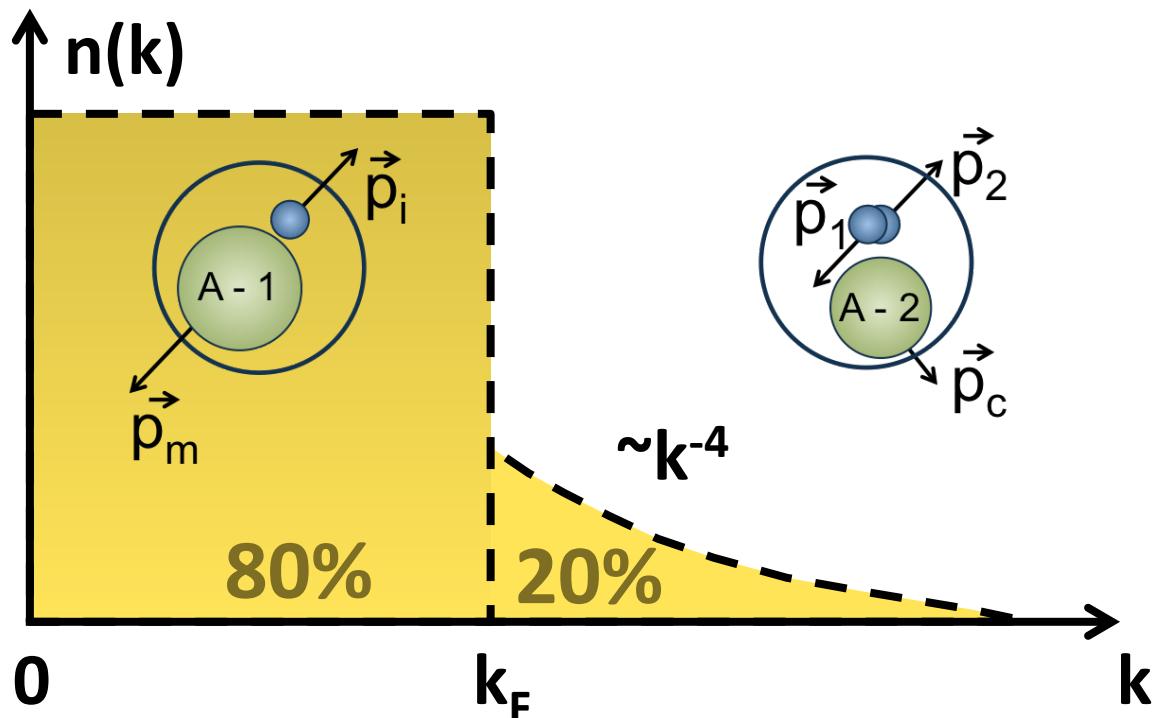

$n_{NN}(q,Q)$

Toy model to the rescue

Build an ideal “contact interaction” system:

- Free Fermi Gas for $k < k_F$
- 2N Correlations with $n_{\text{rel}} \sim 1/k^4$ and $n_Q \sim \text{Gaussian}$ for $k > k_F$

Fermi Gas
Model

Toy model to the rescue

Build an ideal “contact interaction” system:

Free Fermi Gas for $k < k_F$

2N Correlations with $n_{\text{rel}} \sim 1/k^4$ and $n_Q \sim \text{Gaussian}$ for $k > k_F$

Use Monte Carlo to raffle nucleons and pairs,
and construct the one body and two body
momentum distributions

Toy model to the rescue

Build an ideal “contact interaction” system:

Free Fermi Gas for $k < k_F$

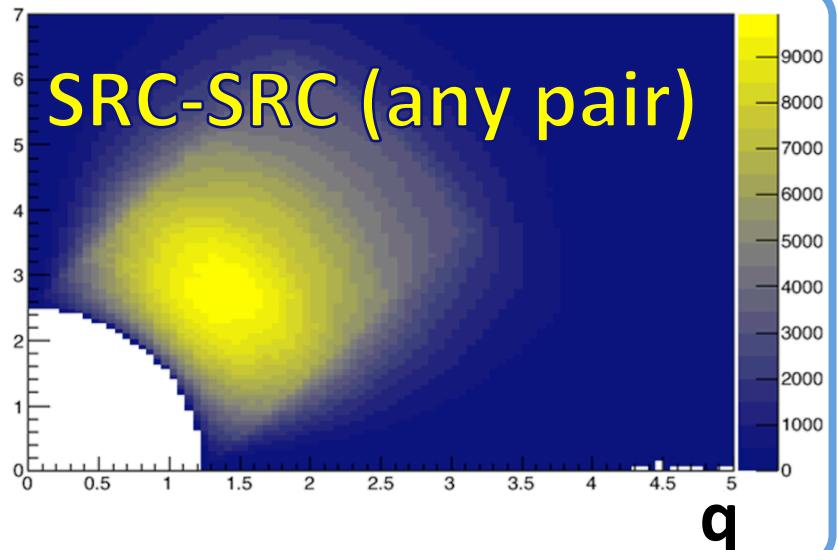

2N Correlations with $n_{\text{rel}} \sim 1/k^4$ and $n_Q \sim \text{Gaussian}$ for $k > k_F$

Use Monte Carlo to raffle nucleons and pairs,
and construct the one body and two body
momentum distributions

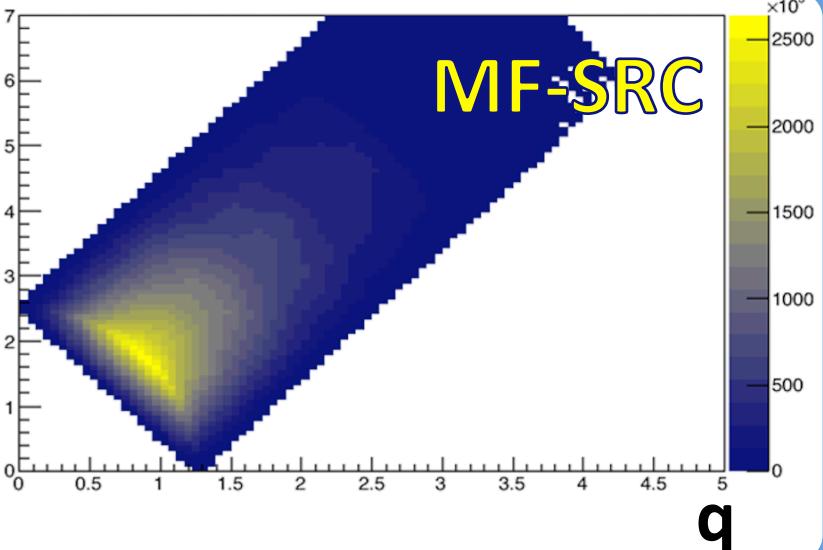

Separate different pairs based on their
‘origin’ (mean-field vs. SRC)

2-Body scaling for Q integrated

- Integrating over Q introduces non-correlated effects above k_F and thus, scaling is only present at very high q (4 fm^{-1}).

R. Weiss, R. Cruz-Torres et al., In-Preperation (2016)

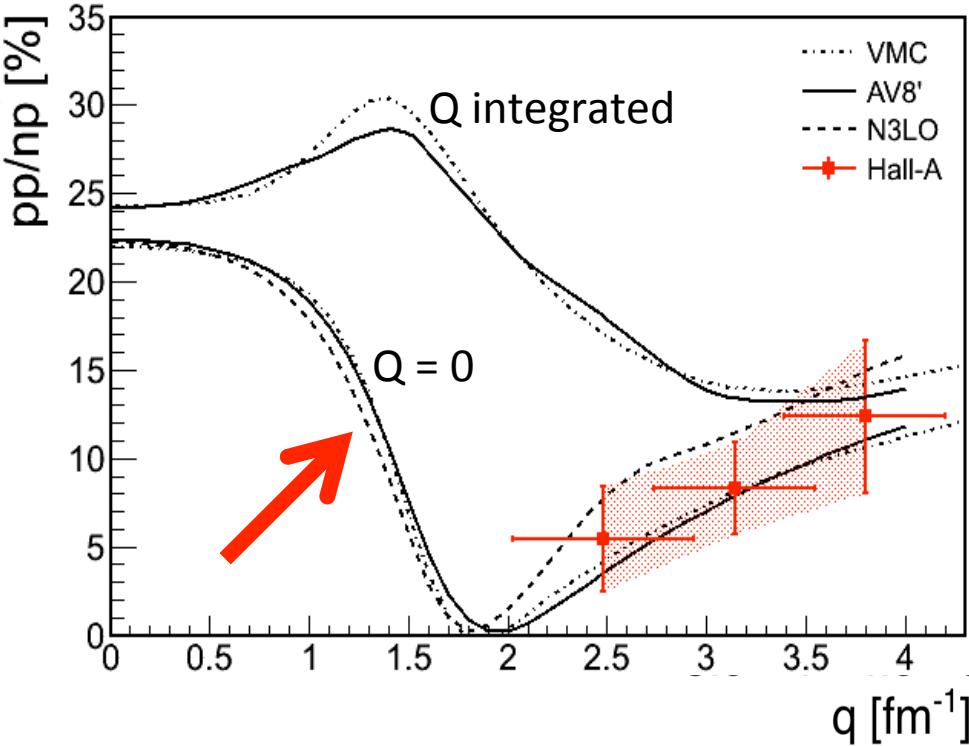

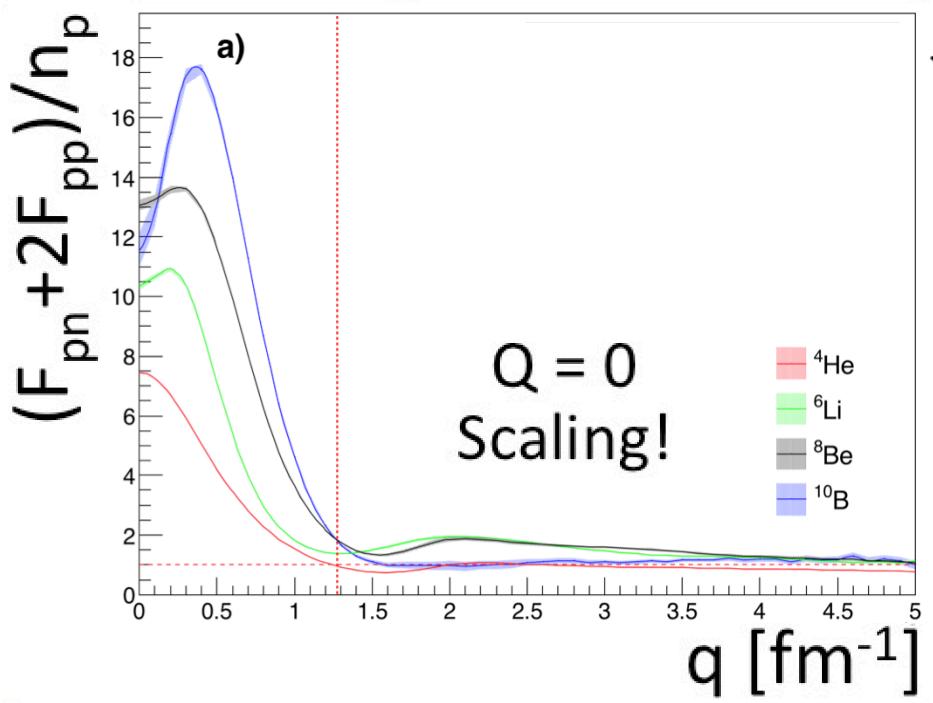

R. Wiringa et al., Phys. Rev. C 89, 024305 (2014).

T. Neff, H. Feldmeier and W. Horiuchi, Phys. Rev. C 92, 024003 (2015).

I. Korover, N. Muangma, and O. Hen et al., Phys. Rev. Lett 113, 022501 (2014).

2-Body scaling for Q=0

- Restricting Q=0 restores scaling starting from $k > k_F$ AND gives consistent results with experimental data!

SRC pairs are consistent with
 $Q = 0$ back-to-back pairs

R. Weiss, R. Cruz-Torres et al., In-Preperation (2016)

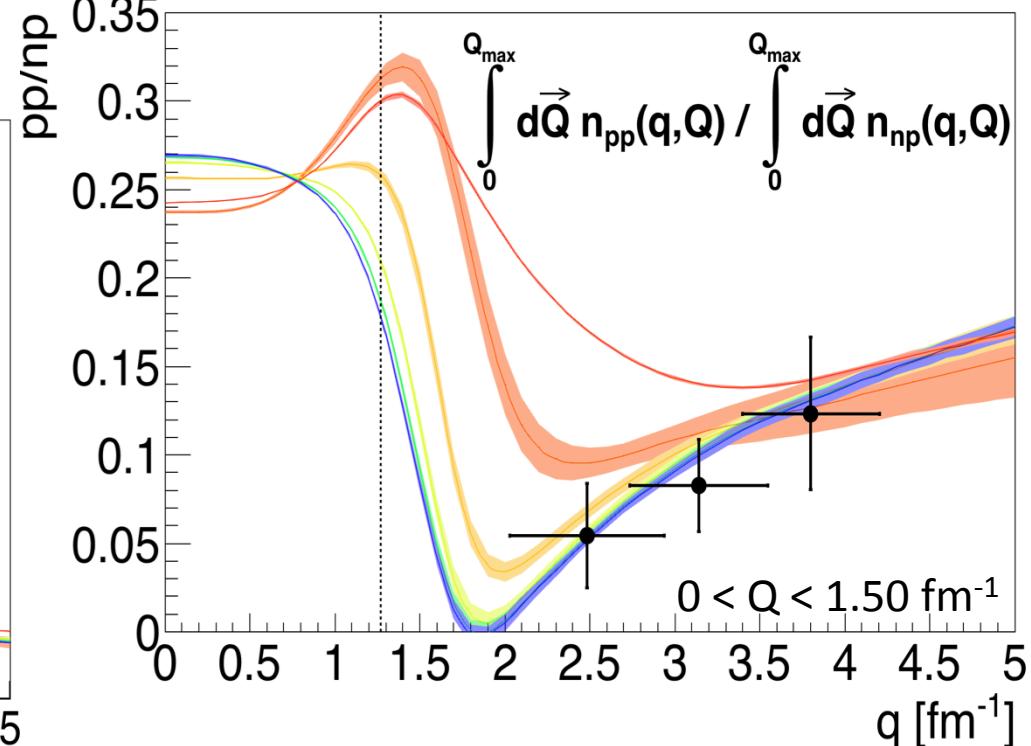

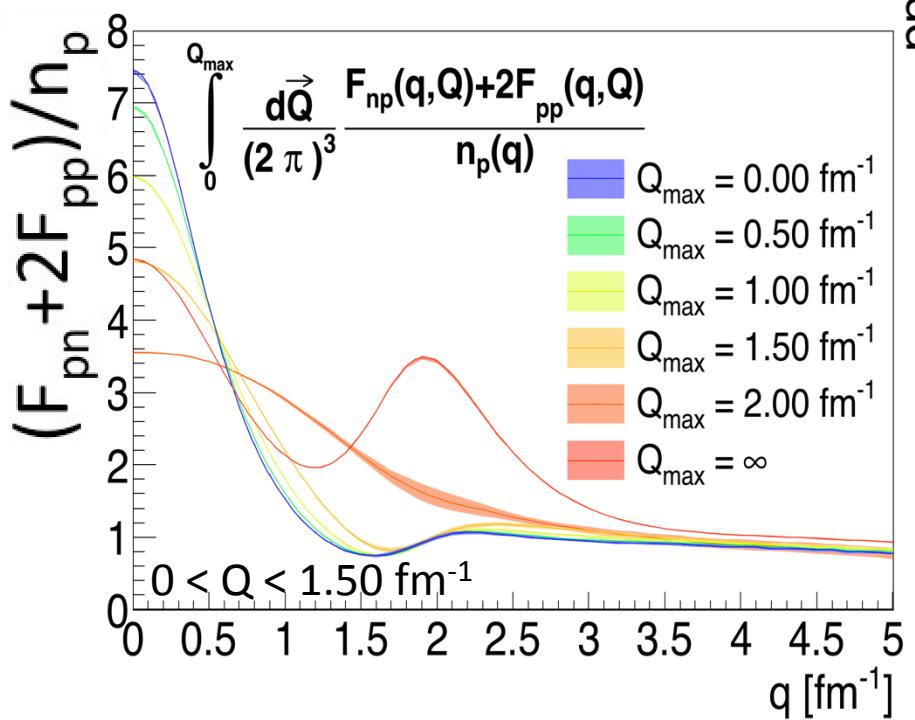

R. Wiringa et al., Phys. Rev. C 89, 024305 (2014).

T. Neff, H. Feldmeier and W. Horiuchi, Phys. Rev. C 92, 024003 (2015).

I. Korover, N. Muangma, and O. Hen et al., Phys. Rev. Lett 113, 022501 (2014).

2-Body scaling: Q dependence

- Restricting $Q=0$ restores scaling starting from $k>k_F$ AND gives consistent results with experimental data!

SRC pairs are consistent with $Q \leq k_F$ back-to-back pairs

R. Weiss, R. Cruz-Torres et al., In-Preperation (2016)

R. Wiringa et al., Phys. Rev. C 89, 024305 (2014).

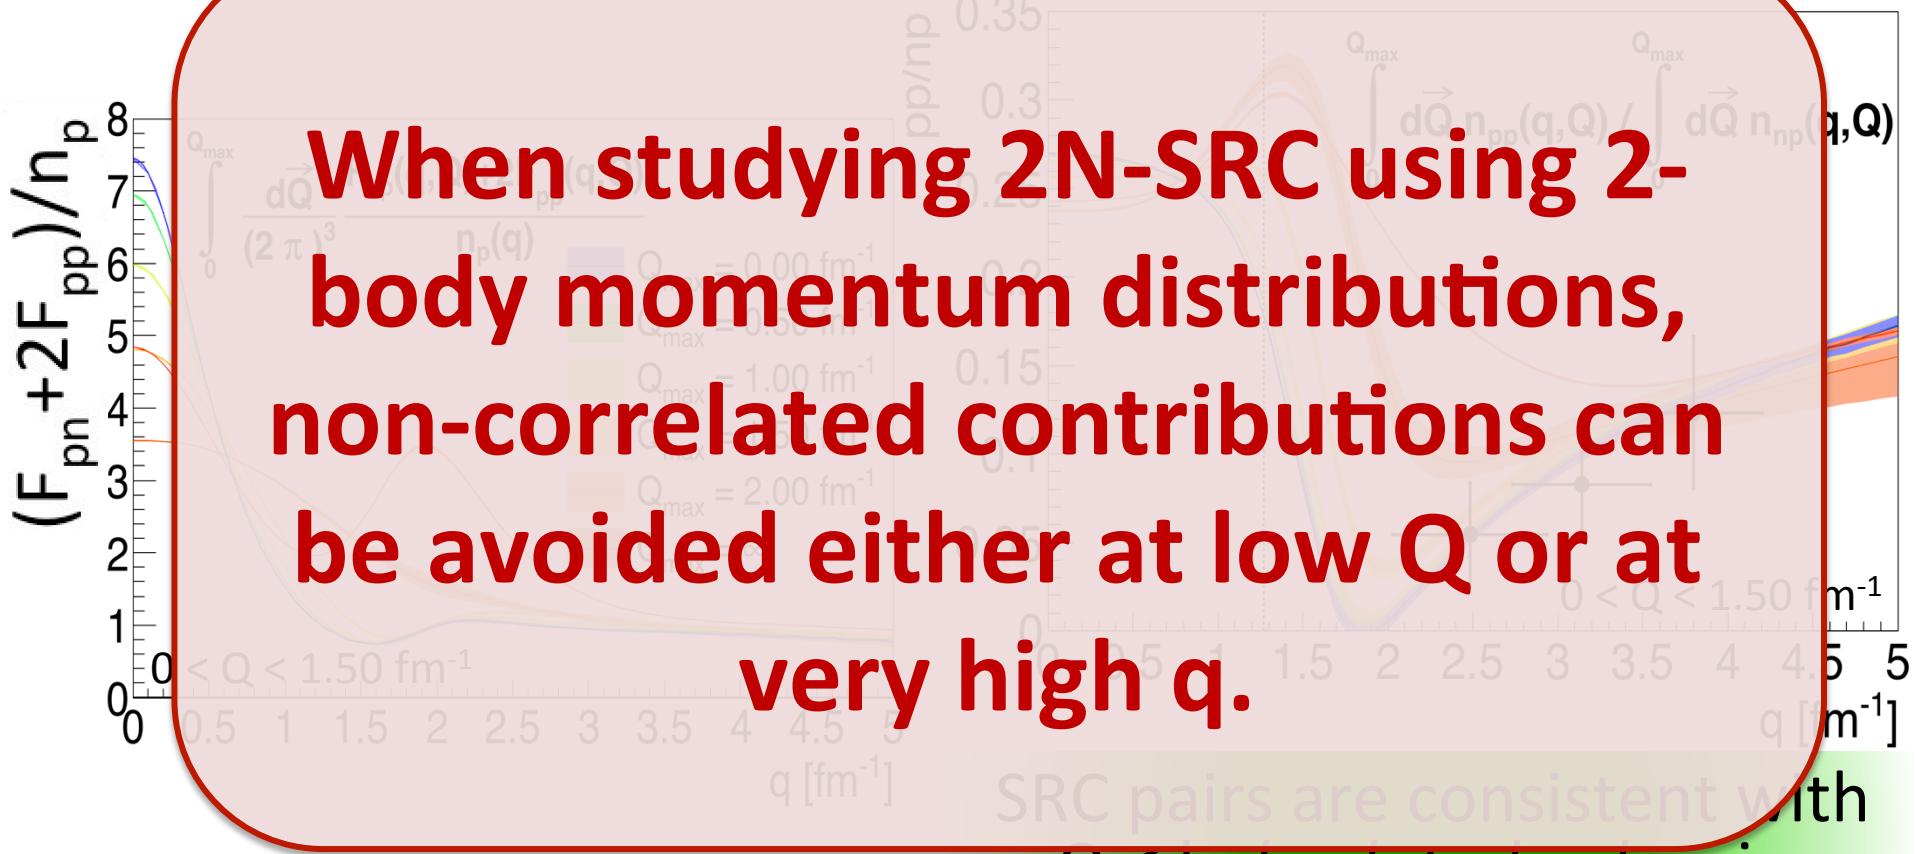

T. Neff, H. Feldmeier and W. Horiuchi, Phys. Rev. C 92, 024003 (2015).

I. Korover, N. Muangma, and O. Hen et al., Phys. Rev. Lett 113, 022501 (2014).

2-Body scaling: Q dependence

- Restricting Q=0 restores scaling starting from $k > k_F$ AND gives consistent results with experimental data!

When studying 2N-SRC using 2-body momentum distributions, non-correlated contributions can be avoided either at low Q or at very high q.
