9.520: Statistical Learning Theory and Applications

February 13, 2012

Vector Space

- A **vector space** is a set V with binary operations

$$+ : V \times V \to V \quad \text{and} \quad \cdot : \mathbb{R} \times V \to V$$

such that for all $a, b \in \mathbb{R}$ and $v, w, x \in V$:

1. $v + w = w + v$
2. $(v + w) + x = v + (w + x)$
3. There exists $0 \in V$ such that $v + 0 = v$ for all $v \in V$
4. For every $v \in V$ there exists $-v \in V$ such that $v + (-v) = 0$
5. $a(bv) = (ab)v$
6. $1v = v$
7. $(a + b)v = av + bv$
8. $a(v + w) = av + aw$

Vector Space

- A **vector space** is a set V with binary operations

$$+\colon V \times V \to V \quad \text{and} \quad \cdot : \mathbb{R} \times V \to V$$

such that for all $a, b \in \mathbb{R}$ and $v, w, x \in V$:

1. $v + w = w + v$
2. $(v + w) + x = v + (w + x)$
3. There exists $0 \in V$ such that $v + 0 = v$ for all $v \in V$
4. For every $v \in V$ there exists $-v \in V$ such that $v + (-v) = 0$
5. $a(bv) = (ab)v$
6. $1v = v$
7. $(a + b)v = av + bv$
8. $a(v + w) = av + aw$

- Example: $\mathbb{R}^n$, space of polynomials, space of functions.

Inner Product

- An **inner product** is a function $\langle \cdot, \cdot \rangle \colon V \times V \to \mathbb{R}$ such that for all $a, b \in \mathbb{R}$ and $v, w, x \in V$:

Inner Product

- An **inner product** is a function $\langle \cdot, \cdot \rangle \colon V \times V \to \mathbb{R}$ such that for all $a, b \in \mathbb{R}$ and $v, w, x \in V$:
  1. $\langle v, w \rangle = \langle w, v \rangle$
  2. $\langle av + bw, x \rangle = a \langle v, x \rangle + b \langle w, x \rangle$
  3. $\langle v, v \rangle \geqslant 0$ and $\langle v, v \rangle = 0$ if and only if $v = 0$.

Inner Product

- An **inner product** is a function $\langle \cdot, \cdot \rangle \colon V \times V \to \mathbb{R}$ such that for all $a, b \in \mathbb{R}$ and $v, w, x \in V$:
  1. $\langle v, w \rangle = \langle w, v \rangle$
  2. $\langle av + bw, x \rangle = a\langle v, x \rangle + b\langle w, x \rangle$
  3. $\langle v, v \rangle \geqslant 0$ and $\langle v, v \rangle = 0$ if and only if $v = 0$.
- $v, w \in V$ are orthogonal if $\langle v, w \rangle = 0$.

Inner Product

- An **inner product** is a function $\langle \cdot, \cdot \rangle \colon V \times V \to \mathbb{R}$ such that for all $a, b \in \mathbb{R}$ and $v, w, x \in V$:
  1. $\langle v, w \rangle = \langle w, v \rangle$
  2. $\langle av + bw, x \rangle = a\langle v, x \rangle + b\langle w, x \rangle$
  3. $\langle v, v \rangle \geqslant 0$ and $\langle v, v \rangle = 0$ if and only if $v = 0$.
- $v, w \in V$ are orthogonal if $\langle v, w \rangle = 0$.
- Given $W \subseteq V$, we have $V = W \oplus W^\perp$, where $W^\perp = \{ v \in V \mid \langle v, w \rangle = 0 \text{ for all } w \in W \}$.

Inner Product

- An **inner product** is a function $\langle \cdot, \cdot \rangle \colon V \times V \to \mathbb{R}$ such that for all $a, b \in \mathbb{R}$ and $v, w, x \in V$:
  1. $\langle v, w \rangle = \langle w, v \rangle$
  2. $\langle av + bw, x \rangle = a\langle v, x \rangle + b\langle w, x \rangle$
  3. $\langle v, v \rangle \geqslant 0$ and $\langle v, v \rangle = 0$ if and only if $v = 0$.
- $v, w \in V$ are orthogonal if $\langle v, w \rangle = 0$.
- Given $W \subseteq V$, we have $V = W \oplus W^{\perp}$, where $W^{\perp} = \{ v \in V \mid \langle v, w \rangle = 0 \text{ for all } w \in W \}$.
- Cauchy-Schwarz inequality: $\langle v, w \rangle \leqslant \langle v, v \rangle^{1/2} \langle w, w \rangle^{1/2}$.

Norm

- Can define norm from inner product: $\|v\| = \langle v, v \rangle^{1/2}$.

Norm

- A **norm** is a function $\|\cdot\|: V \to \mathbb{R}$ such that for all $a \in \mathbb{R}$ and $v, w \in V$:
    1. $\|v\| \geqslant 0$, and $\|v\| = 0$ if and only if $v = 0$
    2. $\|av\| = |a| \, \|v\|$
    3. $\|v + w\| \leqslant \|v\| + \|w\|$
- Can define norm from inner product: $\|v\| = \langle v, v\rangle^{1/2}$.

Metric

- Can define metric from norm: $d(v, w) = \|v - w\|$.

Metric

- A **metric** is a function $d \colon V \times V \to \mathbb{R}$ such that for all $v, w, x \in V$:
    1. $d(v, w) \geqslant 0$, and $d(v, w) = 0$ if and only if $v = w$
    2. $d(v, w) = d(w, v)$
    3. $d(v, w) \leqslant d(v, x) + d(x, w)$
- Can define metric from norm: $d(v, w) = \|v - w\|$.

Basis

- $B = \{v_1, \ldots, v_n\}$ is a **basis** of V if every $v \in V$ can be uniquely decomposed as

$$v = a_1 v_1 + \cdots + a_n v_n$$

for some $a_1, \ldots, a_n \in \mathbb{R}$.

Basis

- $B = \{v_1, \ldots, v_n\}$ is a **basis** of V if every $v \in V$ can be uniquely decomposed as

$$v = a_1 v_1 + \cdots + a_n v_n$$

for some $a_1, \ldots, a_n \in \mathbb{R}$.

- An orthonormal basis is a basis that is orthogonal ($\langle v_i, v_j \rangle = 0$ for $i \neq j$) and normalized ($\|v_i\| = 1$).

Hilbert Space, overview

- Goal: to understand Hilbert spaces (complete inner product spaces) and to make sense of the expression

$$f = \sum_{i=1}^{\infty} \langle f, \phi_i \rangle \phi_i, \quad f \in \mathcal{H}$$

- Need to talk about:
  1. Cauchy sequence
  2. Completeness
  3. Density
  4. Separability

Cauchy Sequence

- Recall: $\lim_{n\to\infty} x_n = x$ if for every $\epsilon > 0$ there exists $N \in \mathbb{N}$ such that $\|x - x_n\| < \epsilon$ whenever $n \geqslant \mathbb{N}$.

Cauchy Sequence

- Recall: $\lim_{n\to\infty} x_n = x$ if for every $\epsilon > 0$ there exists $N \in \mathbb{N}$ such that $\|x - x_n\| < \epsilon$ whenever $n \geqslant \mathbb{N}$.
- $(x_n)_{n\in\mathbb{N}}$ is a **Cauchy sequence** if for every $\epsilon > 0$ there exists $N \in \mathbb{N}$ such that $\|x_m - x_n\| < \epsilon$ whenever $m, n \geqslant N$.

Cauchy Sequence

- Recall: $\lim_{n\to\infty} x_n = x$ if for every $\epsilon > 0$ there exists $N \in \mathbb{N}$ such that $\|x - x_n\| < \epsilon$ whenever $n \geqslant \mathbb{N}$.
- $(x_n)_{n\in\mathbb{N}}$ is a **Cauchy sequence** if for every $\epsilon > 0$ there exists $N \in \mathbb{N}$ such that $\|x_m - x_n\| < \epsilon$ whenever $m, n \geqslant N$.
- Every convergent sequence is a Cauchy sequence (why?)

Completeness

- A normed vector space V is **complete** if every Cauchy sequence converges.

Completeness

- A normed vector space V is **complete** if every Cauchy sequence converges.
- Examples:
  1. $\mathbb{Q}$ is not complete.
  2. $\mathbb{R}$ is complete (axiom).
  3. $\mathbb{R}^n$ is complete.
  4. Every finite dimensional normed vector space (over $\mathbb{R}$) is complete.

Hilbert Space

- A **Hilbert space** is a complete inner product space.

Hilbert Space

- A **Hilbert space** is a complete inner product space.
- Examples:
  1. $\mathbb{R}^n$
  2. Every finite dimensional inner product space.
  3. $\ell_2 = \{(a_n)_{n=1}^{\infty} \mid a_n \in \mathbb{R}, \ \sum_{n=1}^{\infty} a_n^2 < \infty\}$
  4. $L_2([0,1]) = \{f \colon [0,1] \to \mathbb{R} \mid \int_0^1 f(x)^2 \, dx < \infty\}$

Density

- Y is **dense** in X if $\overline{Y} = X$.

Density

- Y is **dense** in X if $\overline{Y} = X$.
- Examples:
  1. $\mathbb{Q}$ is dense in $\mathbb{R}$.
  2. $\mathbb{Q}^n$ is dense in $\mathbb{R}^n$.
  3. Weierstrass approximation theorem: polynomials are dense in continuous functions (with the supremum norm, on compact domains).

Separability

- X is **separable** if it has a countable dense subset.

Separability

- X is **separable** if it has a countable dense subset.
- Examples:
  1. $\mathbb{R}$ is separable.
  2. $\mathbb{R}^n$ is separable.
  3. ℓ_2, $L_2([0,1])$ are separable.

Orthonormal Basis

- A Hilbert space has a countable orthonormal basis if and only if it is separable.
- Can write:

$$f = \sum_{i=1}^{\infty} \langle f, \phi_i \rangle \phi_i \quad \text{for all } f \in \mathcal{H}.$$

Orthonormal Basis

- A Hilbert space has a countable orthonormal basis if and only if it is separable.
- Can write:

$$f = \sum_{i=1}^{\infty} \langle f, \phi_i \rangle \phi_i \quad \text{for all } f \in \mathcal{H}.$$

- Examples:
  1. Basis of ℓ_2 is $(1, 0, \dots,), (0, 1, 0, \dots), (0, 0, 1, 0, \dots), \dots$
  2. Basis of $L_2([0, 1])$ is $1, 2\sin 2\pi n x, 2\cos 2\pi n x$ for $n \in \mathbb{N}$

Maps

Next we are going to review basic properties of maps on a Hilbert space.

- functionals: $\Psi : \mathcal{H} \to \mathbb{R}$
- linear operators $A : \mathcal{H} \to \mathcal{H}$, such that $A(af + bg) = aAf + bAg$, with $a, b \in \mathbb{R}$ and $f, g \in \mathcal{H}$.

Representation of Continuous Functionals

Let $\mathcal{H}$ be a Hilbert space and $g \in \mathcal{H}$, then

$$\Psi_g(f) = \langle f, g \rangle, \qquad f \in \mathcal{H}$$

is a continuous linear functional.

Riesz representation theorem

The theorem states that every continuous linear functional Ψ can be written uniquely in the form,

$$\Psi(f) = \langle f, g \rangle$$

for some appropriate element $g \in \mathcal{H}$.

1. Vector Spaces
2. Hilbert Spaces
3. Matrices
4. Linear Operators

Matrix

- Every linear operator $L\colon \mathbb{R}^m \to \mathbb{R}^n$ can be represented by an $m \times n$ matrix A.

Matrix

- Every linear operator $L\colon \mathbb{R}^m \to \mathbb{R}^n$ can be represented by an $m \times n$ matrix A.
- If $A \in \mathbb{R}^{m\times n}$, the transpose of A is $A^\top \in \mathbb{R}^{n\times m}$ satisfying

$$\langle Ax, y\rangle_{\mathbb{R}^m} = (Ax)^\top y = x^\top A^\top y = \langle x, A^\top y\rangle_{\mathbb{R}^n}$$

for every $x \in \mathbb{R}^n$ and $y \in \mathbb{R}^m$.

Matrix

- Every linear operator $L \colon \mathbb{R}^m \to \mathbb{R}^n$ can be represented by an $m \times n$ matrix A.
- If $A \in \mathbb{R}^{m \times n}$, the transpose of A is $A^\top \in \mathbb{R}^{n \times m}$ satisfying
$$\langle Ax, y \rangle_{\mathbb{R}^m} = (Ax)^\top y = x^\top A^\top y = \langle x, A^\top y \rangle_{\mathbb{R}^n}$$
for every $x \in \mathbb{R}^n$ and $y \in \mathbb{R}^m$.
- A is symmetric if $A^\top = A$.

Eigenvalues and Eigenvectors

- Let $A \in \mathbb{R}^{n \times n}$. A nonzero vector $v \in \mathbb{R}^n$ is an eigenvector of A with corresponding eigenvalue $\lambda \in \mathbb{R}$ if $Av = \lambda v$.

Eigenvalues and Eigenvectors

- Let $A \in \mathbb{R}^{n \times n}$. A nonzero vector $v \in \mathbb{R}^n$ is an eigenvector of A with corresponding eigenvalue $\lambda \in \mathbb{R}$ if $Av = \lambda v$.
- Symmetric matrices have real eigenvalues.

Eigenvalues and Eigenvectors

- Let $A \in \mathbb{R}^{n \times n}$. A nonzero vector $v \in \mathbb{R}^n$ is an eigenvector of A with corresponding eigenvalue $\lambda \in \mathbb{R}$ if $Av = \lambda v$.
- Symmetric matrices have real eigenvalues.
- **Spectral Theorem:** Let A be a symmetric $n \times n$ matrix. Then there is an orthonormal basis of $\mathbb{R}^n$ consisting of the eigenvectors of A.

Eigenvalues and Eigenvectors

- Let $A \in \mathbb{R}^{n \times n}$. A nonzero vector $v \in \mathbb{R}^n$ is an eigenvector of A with corresponding eigenvalue $\lambda \in \mathbb{R}$ if $Av = \lambda v$.
- Symmetric matrices have real eigenvalues.
- **Spectral Theorem:** Let A be a symmetric $n \times n$ matrix. Then there is an orthonormal basis of $\mathbb{R}^n$ consisting of the eigenvectors of A.
- Eigendecomposition: $A = V \Lambda V^\top$, or equivalently,

$$A = \sum_{i=1}^{n} \lambda_i v_i v_i^\top .$$

Singular Value Decomposition

- Every $A \in \mathbb{R}^{m \times n}$ can be written as

$$A = U\Sigma V^\top,$$

where $U \in \mathbb{R}^{m \times m}$ is orthogonal, $\Sigma \in \mathbb{R}^{m \times n}$ is diagonal, and $V \in \mathbb{R}^{n \times n}$ is orthogonal.

Singular Value Decomposition

- Every $A \in \mathbb{R}^{m \times n}$ can be written as
$$A = U \Sigma V^\top,$$
where $U \in \mathbb{R}^{m \times m}$ is orthogonal, $\Sigma \in \mathbb{R}^{m \times n}$ is diagonal, and $V \in \mathbb{R}^{n \times n}$ is orthogonal.
- Singular system:

$$Av_i = \sigma_i u_i \qquad AA^\top u_i = \sigma_i^2 u_i$$
$$A^\top u_i = \sigma_i v_i \qquad A^\top A v_i = \sigma_i^2 v_i$$

Matrix Norm

- The spectral norm of $A \in \mathbb{R}^{m \times n}$ is

$$\|A\|_{\text{spec}} = \sigma_{\max}(A) = \sqrt{\lambda_{\max}(AA^\top)} = \sqrt{\lambda_{\max}(A^\top A)}.$$

Matrix Norm

- The spectral norm of $A \in \mathbb{R}^{m \times n}$ is

$$\|A\|_{\text{spec}} = \sigma_{\max}(A) = \sqrt{\lambda_{\max}(AA^\top)} = \sqrt{\lambda_{\max}(A^\top A)}.$$

- The Frobenius norm of $A \in \mathbb{R}^{m \times n}$ is

$$\|A\|_F = \sqrt{\sum_{i=1}^{m} \sum_{j=1}^{n} a_{ij}^2} = \sqrt{\sum_{i=1}^{\min\{m,n\}} \sigma_i^2}.$$

Positive Definite Matrix

A real symmetric matrix $A \in \mathbb{R}^{m \times m}$ is positive definite if

$$x^t A x > 0, \quad \forall x \in \mathbb{R}^m.$$

A positive definite matrix has positive eigenvalues.

Note: for positive semi-definite matrices $>$ is replaced by $\geqslant$.

1. Vector Spaces
2. Hilbert Spaces
3. Matrices
4. Linear Operators

Linear Operator

- An operator $\mathsf{L} \colon \mathcal{H}_1 \to \mathcal{H}_2$ is linear if it preserves the linear structure.

Linear Operator

- An operator $L: \mathcal{H}_1 \to \mathcal{H}_2$ is linear if it preserves the linear structure.
- A linear operator $L: \mathcal{H}_1 \to \mathcal{H}_2$ is bounded if there exists $C > 0$ such that

$$\|Lf\|_{\mathcal{H}_2} \leqslant C\|f\|_{\mathcal{H}_1} \quad \text{for all } f \in \mathcal{H}_1.$$

Linear Operator

- An operator $L \colon \mathcal{H}_1 \to \mathcal{H}_2$ is linear if it preserves the linear structure.
- A linear operator $L \colon \mathcal{H}_1 \to \mathcal{H}_2$ is bounded if there exists $C > 0$ such that

$$\|Lf\|_{\mathcal{H}_2} \leqslant C\|f\|_{\mathcal{H}_1} \quad \text{for all } f \in \mathcal{H}_1.$$

- A linear operator is continuous if and only if it is bounded.

Adjoint and Compactness

- The adjoint of a bounded linear operator $\mathsf{L}\colon \mathcal{H}_1 \to \mathcal{H}_2$ is a bounded linear operator $\mathsf{L}^*\colon \mathcal{H}_2 \to \mathcal{H}_1$ satisfying

$$\langle \mathsf{L}\mathsf{f}, \mathsf{g}\rangle_{\mathcal{H}_2} = \langle \mathsf{f}, \mathsf{L}^*\mathsf{g}\rangle_{\mathcal{H}_1} \quad \text{for all } \mathsf{f} \in \mathcal{H}_1, \mathsf{g} \in \mathcal{H}_2.$$

- L is self-adjoint if $\mathsf{L}^* = \mathsf{L}$. Self-adjoint operators have real eigenvalues.

Adjoint and Compactness

- The adjoint of a bounded linear operator $L: \mathcal{H}_1 \to \mathcal{H}_2$ is a bounded linear operator $L^*: \mathcal{H}_2 \to \mathcal{H}_1$ satisfying

$$\langle Lf, g\rangle_{\mathcal{H}_2} = \langle f, L^* g\rangle_{\mathcal{H}_1} \quad \text{for all } f \in \mathcal{H}_1, g \in \mathcal{H}_2.$$

- L is self-adjoint if $L^* = L$. Self-adjoint operators have real eigenvalues.
- A bounded linear operator $L: \mathcal{H}_1 \to \mathcal{H}_2$ is compact if the image of the unit ball in $\mathcal{H}_1$ has compact closure in $\mathcal{H}_2$.

Spectral Theorem for Compact Self-Adjoint Operator

- Let $L: \mathcal{H} \to \mathcal{H}$ be a compact self-adjoint operator. Then there exists an orthonormal basis of $\mathcal{H}$ consisting of the eigenfunctions of L,

$$L\phi_i = \lambda_i \phi_i$$

and the only possible limit point of λ_i as $i \to \infty$ is 0.

Spectral Theorem for Compact Self-Adjoint Operator

- Let $L\colon \mathcal{H} \to \mathcal{H}$ be a compact self-adjoint operator. Then there exists an orthonormal basis of $\mathcal{H}$ consisting of the eigenfunctions of L,

$$L\phi_i = \lambda_i \phi_i$$

and the only possible limit point of λ_i as $i \to \infty$ is 0.

- Eigendecomposition:

$$L = \sum_{i=1}^{\infty} \lambda_i \langle \phi_i, \cdot \rangle \phi_i.$$
